

MI-103 Deer Fence and Field Fence Construction

(This section last updated 07-02-15)

MI-103 shows several different brace panel layouts:

BRACE PANEL LAYOUT

Distances of concern are between:

- Two end posts,
- Two pull posts,
- A gate post and a pull post,
- An end post and a gate post, and
- An end post and a pull post.

When the distance is less than 160 feet, one brace post and panel is needed. When the distance exceeds 160 feet, an extra brace post and panel is needed. When the distance exceeds 960 feet, an intermediate pull post plus two additional brace posts and panels are needed.

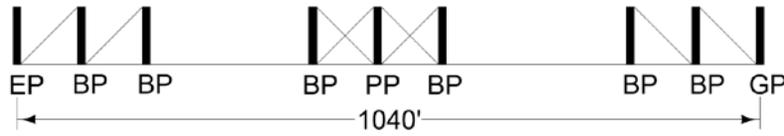

As an example, if the distance between an end post and a gate post is 145 feet, one brace post and panel is required with the end post, and one brace post and panel is required at the gate post.

If the distance is 620 feet, two brace posts and panels are required at the end post, and two brace posts and panels are required at the gate post.

If the distance is 1040 feet, an intermediate pull post with two brace posts and panels is needed.

As another example, if the distance from an end post is a corner post is 120 feet and the distance to the next end post is 575 feet the layout would look as follows:
