
PV-204 PCC Railroad Approach Section

(This section last updated 01-22-15)

The approach pavement needs to match the grade of the tracks at the crossing. This means the pavement will need to be warped to transition to the cross slope of the proposed or existing pavement. Designers may want to include additional cross sections for this transition.

Designers also need to consider intakes that may exist adjacent to the approach section area. Pavement will need to be warped to accommodate those structures.
