
100-19 Perimeter and Slope Sediment Control Device

(This section last updated 09-13-12)

Refer to Design Manual [10C-1](#), Standard Road Plan [EC-204](#), and Sections [2602](#) and [4169](#) in the Specifications for additional information.

The tabulation is set up to match the diameters provided by the bid item descriptions for these devices. These bid items were created using the manufactured sizes for Wood Excelsior Logs and Straw Wattles. Since the bid items are titled Perimeter and Slope Sediment Control Devices, the Contractor has the option of using either of those two products or Filter Socks.

Since these devices are generally used in conjunction with silt fence, tab the diameter as determined in Design Manual [10C-1](#). Do not tabulate the 6 inch or 9 inch size unless recommended by Roadside Development, Office of Construction, District Personnel, or RCE.

Please note, the Removal Bid Item (if applicable) for these devices is to be detailed in the plans. Since these devices are usually left in place to degrade, the Removal item was left off the tabulation.
