

570-03 Temporary Sediment Control Basin

(This section last updated 01-07-16)

Temporary Sediment Control Basins are typically used for drainage basins 10 acres or larger, where they are required. They are also used as a supplement to silt fence ditch checks, rock check dams, and silt basins if those devices don't provide enough storm water storage volume. Sections [10C-1](#) and [10C-2](#) provide more information regarding use of and tabbing temporary sediment control basins.
